Abstract of JP 2001220783 (A)

PROBLEM TO BE SOLVED: To provide a rotary suction mechanism for use of a shower hose retainer and another rotary suction mechanism for use of a grip bar, enabling the shower hose retainer and the grip bar to be easily attached to and removed from a wall surface without screwing.

SOLUTION: The rotary suction mechanism is used for the shower hose retainer 1 including a bowl-shaped sucker 2 made of an elastic material sucking the wall surface W, and a retainer body consisting of a base part 3 disposed to be capable of touching the outer peripheral edge of the upper surface of the sucker and an operating part 4 rotatably disposed on the base part 3. A shower hose retaining part is provided between the operating part 4 and the base part 3 and in a position on the outer periphery of the base part 3. With the base part touching the outer peripheral edge of the upper surface of the sucker, the sucker is raised in a direction perpendicular to the wall surface as the operating part is rotated, and the shower hose retainer is attached to the wall surface by a suction force produced.
